Changes:

Revision 1.2 adds:

- Bytes 126, 127: Additional Information for “backward compatibility”
- Bytes 93-94: Manufacturing Date Code
- Bytes 30-33: Additional Timing Information
- Byte 5: Changed the nomenclature from Bank to Row on the DIMM to remove confusion of Rows vs. Banks on a DIMM

Revision 1.1 adds comments to clarify several Bytes:

- Bytes 3-4: Note added to clarify address row/column 1/16 rollup useage.
- Bytes 5,17: Note added to clarify Module, SDRAM Device bank useage.
- Bytes 23-26: Note added to clarify timing1/16ns rollup useage.

1.0 Introduction

This specification defines the Serial Presence Detect (SPD) electrical and Data Structure requirements for Synchronous DRAM Dual In-Line Memory Modules (SDRAM DIMMs) and Small-outline Memory Modules (SO-DIMM). These SDRAM DIMMs are intended for use as main memory installed on personal computer, *work-station, and/or server* motherboards.

This specification largely follows the JEDEC defined 168-pin and SO-144 SDRAM DIMM SPD specs as of July 1996. *Changes in process are currently shown in italics.*

2.0 SDRAM Module Performance Grades

Three performance grades are defined in the SPD matrix:

CAS Latency x	highest latency, lowest performance
CAS Latency x-1	2nd highest latency
CAS Latency x-2	3rd highest latency, highest performance (may restrict freq)

This is a relative series of three latencies, CL x being the most commonly available at this speed grade.

The performance grade of the module is determined by the read data access time (T_{ac}), and RAS cycle time (T_{rc}) supported by the SDRAM components.

Latency numbers in the sequence will depend on the speeds which are supported by the module.

3.0 EEPROM Component Specifications

The Serial Presence Detect function is implemented using a 2048 bit EEPROM component. This nonvolatile storage device contains data programmed by the DIMM manufacturer that identifies the module type and various SDRAM organization and timing parameters. System read/write operations to the EEPROM device occur via a standard I²C bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA(2:0) which provide the EEPROM Device Address. If the EEPROM device has a Write Protect input pin, it must be tied in the non-write protect state on the DIMM PCB. The EEPROM device selected by the DIMM manufacturer must use the SA(2:0) device address signals. The EEPROM must operate with a V_{CC} of 3.0 Vdc to 3.6 Vdc.

Table 1: EEPROM Component Absolute Maximum Ratings

Parameter	Range
All Input or Output Voltages with Respect to Ground	+4.6V to -0.3V
Ambient Storage Temperature	-40 °C to +100 °C

Table2: EEPROM Component Operating Conditions

Parameter	Range
Ambient Operating Temperature	0 °C to +70 °C
Positive Power Supply	3.0V to 3.6V

Table 3: EEPROM Component A.C. and D.C. Characteristics

Symbol	Parameter	Test Conditions	Min	Max	Units
I _{CCA}	Active Power Supply Current	f _{SCL} = 100 kHz		5.0	mA
I _{SB}	Standby Current	V _{IN} = GND or V _{CC}		100	uA
I _{LI}	Input Leakage Current	V _{IN} = GND or V _{CC}		10	uA
I _{LO}	Output Leakage Current	V _{OUT} = GND to V _{CC}		10	uA
V _{IL}	Input Low Voltage		-0.3	V _{CC} X 0.3	V
V _{IH}	Input High Voltage		V _{CC} X 0.7		V
V _{OL}	Output Low Voltage	I _{OL} = 3.0 mA		0.4	V

Table 4: EEPROM Component A.C. Timing Parameters

Symbol	Parameter	Min	Max	Units
f_{SCL}	SCL Clock Frequency		80	kHz
T_I	Noise Suppression Time Constant at SCL, SDA inputs		100	ns
t_{AA}	SCL Low to SDA Data Out Valid	0.3	7.0	us
t_{BUF}	Time the Bus Must Be Free before a New Transmission Can Start	6.7		us
$t_{HD:STA}$	Start Condition Hold Time	4.5		us
t_{LOW}	Clock Low Time	6.7		us
t_{HIGH}	Clock High Time	4.5		us
$t_{SU:STA}$	Start Condition Setup Time (for a Repeated Start Condition)	6.7		us
$t_{HD:DAT}$	Data In Hold Time	0		us
$t_{SU:DAT}$	Data In Setup Time	500	1	ns
t_R	SDA and SCL Rise Time		1	us
t_F	SDA and SCL Fall Time		300	ns
$t_{SU:STO}$	Stop Condition Setup Time	6.7		us
t_{DH}	Data Out Hold Time	300		ns
t_{WR}	Write Cycle Time		15	ms

Note: The write cycle time (t_{WR}) is the time from a valid stop condition of a write sequence to the end of the EEPROM internal erase/program cycle. During the write cycle, the EEPROM bus interface circuits are disabled, SDA remains high due to pull-up resistor, and the EEPROM does not respond to its slave address.

4.0 Serial Presence Detect EEPROM Data

Table 5: Serial Presence Detect Data Format

Byte Number	Function	Required/ Optional
0	Defines # of bytes written into serial memory at module manufacturer	Required
1	Total # of bytes of SPD memory device	Required
2	Fundamental memory type (FPM, EDO, SDRAM..) <i>from Appendix A</i>	Required
3	# of row addresses on this assembly (<i>includes Mixed-size Row addr</i>)	Required
4	# Column Addresses on this assembly (<i>includes Mixed-size Col addr</i>)	Required
5	# Module Rows on this assembly	Required
6	Data Width of this assembly	Required
7	... Data Width continuation	Required
8	Voltage interface standard of this assembly	Required
9	SDRAM Cycle time, CL=X (highest CAS latency)	Required
10	SDRAM Access from Clock (highest CAS latency)	Required
11	DIMM Configuration type (non-parity, ECC)	Required
12	Refresh Rate/Type	Required
13	<i>Primary SDRAM Width</i>	Required
14	<i>Error Checking SDRAM width</i>	Required
15	Minimum Clock Delay Back to Back Random Column Address	Required*
16	Burst Lengths Supported	Required*
17	# of Banks on Each SDRAM Device	Required*
18	CAS# Latencies Supported	Required*
19	CS# Latency	Required*
20	Write Latency	Required*
21	<i>SDRAM Module Attributes</i>	Required*
22	<i>SDRAM Device Attributes: General</i>	Required*
23	<i>Min SDRAM Cycle time at CL X-1 (2nd highest CAS latency)</i>	Required*
24	<i>SDRAM Access from Clock at CL X-1 (2nd highest CAS latency)</i>	Required*
25	<i>Min SDRAM Cycle time at CL X-2 (3rd highest CAS latency)</i>	Optional*
26	<i>Max SDRAM Access from Clock at CL X-2 (3rd highest CAS latency)</i>	Optional*
27	<i>Min Row Precharge Time (Trp)</i>	Required*
28	<i>Min Row Active to Row Active (Trrd)</i>	Required*
29	<i>Min RAS to CAS Delay (Trcd)</i>	Required*
30	<i>Minimum RAS Pulse Width (Tras)</i>	Required*
31	<i>Density of each row on module (mixed, non-mixed sizes)</i>	Required
32-61	Superset Information (may be used in future)	
62	SPD Data Revision Code	Required
63	Checksum for bytes 0-62	Required
64-71	Manufacturer's JEDEC ID code per JEP-108E	Optional
72	Manufacturing Location	Optional
73-90	Manufacturer's Part Number	Optional
91-92	Revision Code	Optional
93-94	Manufacturing Date	Optional
95-98	Assembly Serial Number	Optional
99-125	Manufacturer Specific Data	Optional
126	Intel specification frequency	Required
127	Intel Specification CAS# Latency support	Required
128+	Unused storage locations	

Notes: **Required/Optional*** (bold*) are SDRAM only bytes

Byte 0 - Number of Bytes used by Module Manufacturer (General)

This field describes the total number of bytes used by the module manufacturer for the SPD data and any (optional) specific supplier information. The byte count includes the fields for all required and optional data.

Number of bytes	Hex Value
Undefined	00
1	01
2	02
3	03
.	.
128	80
.	.
254	FE
255	FF

Byte 1 - Total SPD Memory Size (General)

This field describes the total size of the serial memory used to hold the Serial Presence Detect data.

Serial Memory Size	Hex Value
RFU	00
2 Bytes	01
4 Bytes	02
8 Bytes	03
16 Bytes	04
32 Bytes	05
64 Bytes	06
128 Bytes	07
256 Bytes	08
512 Bytes	09
1024 Bytes	0A
2048 Bytes	0B
4096 Bytes	0C
8192 Bytes	0D

Byte 2 - Memory Type (General)

This field describes the fundamental memory type implemented on the module.

Memory Type	Hex Value
EDO	02
SDRAM	04
.	.

Note for Bytes 3-4: Bytes 3-4 show a roll-up value for Hex 1, 2, 3 (i.e., 1row/16rows). For SDRAM devices over duration of REV 1 in Byte 62 (SPD Jedec Rev level), values of 1-3rows/cols are not expected, and Hex equivalent is 16-18rows/columns. Jedec Byte 62 would change rev level if values of 1-3 row/col become available.

Byte 3 - Number of Row Address Bits (SDRAM specific)

This field describes the number of row address bits in the SDRAM array. Note: the number of row address bits does not include the bank selects (BA0, BA1). If the module has only one bank OR if the module has two banks of the same size and organization, then bits 3:0 describe the number of row address bits, and bits 7:4 are 0. If the module has two banks with different size/organization, then bits 3:0 describe the row addressing for bank 1 and bits 7:4 describe the row addressing for bank 2.

Number of Row Addr bits	Bits 3:0 Hex Value
Undefined	0
1/16	1
2/17	2
.	.
7	7
8	8
9	9
10	A
11	B
.	.
14	E
15	F

Number of Row Addr bits	Bits 7:4 Hex Value
Undefined	0
1/16	1
2/17	2
.	.
7	7
8	8
9	9
10	A
11	B
.	.
14	E
15	F

BYTE 4 - Number of Column Address Bits (SDRAM specific)

This field describes the number of column address bits in the SDRAM array. Note: the number of column address bits does not include the bank selects (BA0, BA1), or the AutoPrecharge bit. If the module has only one bank OR if the module has two banks of the same size and organization, then bits 3:0 describe the number of column address bits, and bits 7:4 are 0. If the module has two banks with different size/organization, then bits 3:0 describe the column addressing for bank 1 and bits 7:4 describe the column addressing for bank 2.

Number of Col Addr bits	Bits 3:0 Hex Value
Undefined	0
1/16	1
2/17	2
.	.
7	7
8	8
9	9
10	A
11	B
12	C
13	D
14	E
15	F

Number of Col Addr bits	Bits 7:4 Hex Value
Undefined	0

2/17	2
.	.
7	7
8	8
9	9
10	A
11	B
12	C
13	D
14	E
15	F

BYTE 5 - Number of Module Rows

This field describes the number of rows of SDRAM components on the module. Byte 17 applies to SDRAM device banks (a module with 2 rows could have devices with 2-16 internal banks).

Number of Banks	Hex Value
Undefined	00
1	01
2	02
3	03
.	.
254	FE
255	FF

BYTES 6 & 7 - Module Data Width

This field describes the data width on the SDRAM module. Bit 0 of byte 6 is the LSB and Bit 7 of byte 7 is the MSB.

Module Data Width	Byte 7 (Hex)	Byte 6 (Hex)
Undefined	00	00
1	00	01
2	00	02
3	00	03
.	.	.
32	00	20
.	.	.
36	00	24
.	.	.
64	00	40
.	.	.
72	00	48
.	.	.

.	.	.
128	00	80
.	.	.
144	00	90
.	.	.
160	00	A0
.	.	.
256	01	00.

BYTE 8 - Module Interface Signal Levels

This field describes the SDRAM module signal voltage interface.

Voltage Interface	Hex Value
5.0 Volt/TTL	00
LVTTTL	01
HSTL 1.5	02
SSTL 3.3	03
SSTL 2.5	04
TBD	05
TBD	06
.	.
New Table	FF

BYTE 9 - SDRAM Cycle time (highest CAS latency)

This field defines the total minimum cycle time (clock period) for the SDRAM. For example if the SDRAMs support CAS latency of 3, 2 and 1 (as indicated in byte 18), this byte defines Tclk for CAS latency 3. The byte is broken into two nibbles: the high order nibble (bits 4 through 7) designate the cycle time to a granularity of 1 ns; the value presented by the low order nibble has a granularity of 1/10 ns and is added to the value of the higher nibble.

BYTE 10 - SDRAM Access time from Clock (highest CAS latency)

This field defines the maximum clock to data out for the SDRAM (T_{ac}). For example if the SDRAMs support CAS latency of 3, 2 and 1 (as indicated in byte 18), this byte defines T_{ac} for CAS latency 3. The byte is broken into two nibbles: the high order nibble (bits 4 through 7) designate the cycle time to a granularity of 1 ns; the value presented by the low order nibble has a granularity of 1/10 ns and is added to the value of the higher nibble.

BYTE 11 - Module Configuration Type

This field defines the module's error detection and correction scheme.

Error Detect/Correct	Hex Value
None	00
Parity	01
ECC	02
TBD	03
TBD	04
TBD	05
TBD	06
.	.
TBD	FF

BYTE 12 - Refresh Rate/Type

This field defines the module's refresh rate and type.

Refresh Period	Bit 7, Self Refresh Flag	Bits 6-0 (hex)
Normal (15.625 us)	0	00
Reduced (.25x)...3.9 us	0	01
Reduced (.5x) 7.8 us	0	02

Extended (8x) 125 us	1	05
TBD	1	06
TBD	.	.
TBD	.	.
.	.	.
TBD	1	7F

BYTE 13 - SDRAM Width (Primary SDRAM)

Bits 6:0 of this byte define the data width of the primary SDRAM components used on the module. The primary SDRAM is that which is used for data. Examples of primary (data) SDRAM widths are x4, x8, x16, x32. Bit 7 of this byte is a flag which indicates that a 2nd bank on the module has a primary SDRAM width of 2X that of the first bank. If the module has two banks with the same Primary SDRAM width, then bit 7 remains as "0".

Primary SDRAM Component Data Width	Bits 6:0 Hex Value
Undefined	00
1	01
2	02
3	03
4	04
.	.
8	08
.	.
16	10

32	20
.	.
127	7F

Bank Configuration	Bits 7 Value
No Bank 2 -OR- Bank 2 uses same width Primary SDRAM as Bank 1	0
Bank 2 Primary SDRAM is 2X the width of Bank 1	1

BYTE 14 - Error Checking SDRAM Width

If the module incorporates error checking and if the primary data SDRAM does not include these bits; i.e. there are separate error checking SDRAMs, then the error checking SDRAM's width is expressed in this byte. Examples of error checking SDRAM widths include x4, x8, x16.

Bits 6:0 of this byte define the data width of the Error Checking SDRAM components used on the module. Bit 7 is a flag which indicates that a 2nd bank on the module has Error Checking SDRAM width. of 2X that of the first bank. If the module has two banks with the same Error Checking SDRAM width, then bit 7 remains as "0".

Error Checking SDRAM Component Data Width	Bits 6:0 Hex Value

127	7F

Bank Configuration	Bits 7 Value
No Bank 2 -OR- Bank 2 uses same width EC SDRAM as Bank 1	0
Bank 2 EC SDRAM is 2X the width of Bank 1	1

BYTE 15 - SDRAM Device Attributes, Min Clock Delay for Back to Back Random Column Addresses

Number of Clocks	Hex Value
Undefined	00
1	01
2	02
3	03
4	04
5	05
6	06
.	.
255	FF

BYTE 16 - SDRAM Device Attributes, Burst Lengths Supported

This byte defines various burst lengths supported. If the burst length is supported, then the corresponding bit is “1”

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Burst Length = Page	TBD	TBD	TBD	Burst Length = 8	Burst Length = 4	Burst Length = 2	Burst Length = 1
1 or 0	0	0	0	1 or 0	1 or 0	1 or 0	1 or 0

BYTE 17 - SDRAM Device Attributes, Number of Banks on SDRAM Device

This byte defines the number of banks internal to the SDRAM devices for each row of the DIMMs.

Number of Device Banks	Hex Value
Resvd.	00
1	01
2	02
3	03
4	04
5	05
.	.
.....	...
256	FF

BYTE 18 - SDRAM Device Attributes, CAS Latency

This byte defines which CAS latencies are supported. If the bit is “1” then that CAS Latency is supported.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TBD	CAS Latency = 7	CAS Latency = 6	CAS Latency = 5	CAS Latency = 4	CAS Latency = 3	CAS Latency = 2	CAS Latency = 1
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

BYTE 19 - SDRAM Device Attributes, CS Latency

This byte defines which CS latencies are acceptable for the Module. If the bit is “1” then that CS Latency is supported.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TBD	CS Latency = 6	CS Latency = 5	CS Latency = 4	CS Latency = 3	CS Latency = 2	CS Latency = 1	CS Latency = 0
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

BYTE 20 - SDRAM Device Attributes, WE Latency

This byte defines which CS latencies are acceptable for the Module. If the bit is “1” then that WE Latency is supported.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TBD	WE Latency = 6	WE Latency = 5	WE Latency = 4	WE Latency = 3	WE Latency = 2	WE Latency = 1	WE Latency = 0
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

BYTE 21 - SDRAM Module Attributes

This byte defines various aspects of the module. If the aspect is TRUE, then the corresponding bit is "1".

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TBD	<i>Redundant Row Addr</i>	Differential Clock Input	Registered DQMB Inputs	Buffered DQMB Inputs	On-Card PLL (Clock)	Registered Address/Control Inputs *	Buffered Address/Control Inputs *
0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

* Address, RAS, CAS, WE, CKE, S

** Redundant addressing implies the use of SDRAMs having the same address depth (e.g. 4Mx4 mixed with 4Mx16) in the same 8-byte quad word, but having different RAS/CAS addressing and/or different numbers of device banks. Actual implementation is not yet determined.

BYTE 22 - SDRAM Device Attributes, General

This byte defines various aspects of the SDRAMs on the module. If the aspect is TRUE, then the corresponding bit is "1".

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TBD	TBD	Upper Vcc tolerance: 0 = 10% 1 = 5%	Lower Vcc tolerance: 0 = 10% 1 = 5%	Supports Write1/Read Burst	Supports Precharge All	Supports Auto-Precharge	Supports Early RAS# Precharge
0	0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

Vcc Tolerance refers to the voltage range under which the SDRAMs operate to the timings specified in the SPD bytes 9, 10, 23-30.

Note for Bytes 23-24: Bytes 23-24 show a roll-up value for Hex 1, 2, 3 (i.e., 1ns/16ns). For SDRAM devices over duration of REV 1 in Byte 62 (SPDedec Rev level), values of 1-3ns are not expected, and Hex equivalent is 16-18ns. Jedec Byte 62 will change rev level when values of 1-3 ns become available.

BYTE 23 - SDRAM Cycle time (2nd highest CAS latency)

This field defines the minimum cycle time (clock period) for the SDRAM when operating at its 2nd highest CAS latency. For example if the SDRAMs support CAS latency of 3, 2 and 1 (as indicated in byte 18), this byte defines t_{clk} for CAS latency 2. The byte is broken into two nibbles: the high order nibble (bits 4 through 7) designate the cycle time to a granularity of 1 ns; the value presented by the low order nibble has a granularity of 1/10 ns and is added to the value of the higher nibble.

Nanoseconds	Bits 7-4 Hex Value

15	F

1/10 nanoseconds	Bits 3-0 Hex Value
0	0
1	1
2	2
3	3
4	4
.	.
9	9

BYTE 24 - SDRAM Access from Clock (2nd highest CAS latency)

This field defines the maximum clock to data out for the SDRAM (t_{ac}) when operating at its 2nd highest CAS latency. For example if the SDRAMs support CAS latency of 3, 2 and 1 (as indicated in byte 18), this byte defines t_{ac} for CAS latency 2. The byte is broken into two nibbles: the high order nibble (bits 4 through 7) designate the cycle time to a granularity of 1 ns; the value presented by the low order nibble has a granularity of 1/10 ns and is added to the value of the higher nibble.

3	3
4	4
.	.
9	9

BYTE 25 - SDRAM Cycle time (3rd highest CAS latency)

This field defines the minimum cycle time (clock period) for the SDRAM when operating at its 3rd highest CAS latency. For example if the SDRAMs support CAS latency of 3, 2 and 1 (as indicated in byte 18), this byte defines t_{clk} for CAS latency 1. The byte is broken into two sections: the 6 high order bits (bits 7:2) designate the cycle time to a granularity of 1 ns; the value presented by bits 1:0 has a granularity of 1/4 ns and is added to the value of the higher nibble.

Nanoseconds	Bits 7-2 Binary Value
Undefined	000000

1/4 nanoseconds	Bits 1-0 binary value
0	00
1	01
2	10
3	11

BYTE 26 - SDRAM Access from Clock (3rd highest CAS latency)

This field defines the maximum clock to data out for the SDRAM (t_{ac}) when operated at its 3rd highest CAS latency. For example if the SDRAMs support CAS latency of 3, 2 and 1(as indicated in byte 18), this byte defines t_{ac} for CAS latency 1. The byte is broken into two sections: the 6 high order bits (bits 7:2) designate the access time to a granularity of 1 ns; the value presented by bits 1:0 has a granularity of 1/4 ns and is added to the value of the higher nibble.

Nanoseconds	Bits 7-2 Binary Value
Undefined	000000
1ns	000001
2ns	000010
3ns	000011
4	000100
.	.
63	111111

1/4 nanoseconds	Bits 1-0 Binary Value
0	00
1	01
2	10
3	11

BYTE 27 - Minimum Row Precharge Time

This byte defines the precharge to activate minimum (T_{rp}) using 1ns granularity.

Precharge Minimum	Bits 7-0 Hex Value
undefined	00
1 ns	01
2 ns	02
.	.
30 ns	1E
.	.
45 ns	2D
.	.
255 ns	FF

BYTE 28 - Row Active to Row Active Min

This byte defines the minimum row activate to row activate delay ($t_{r\bar{a}r(d)}$) using 1 ns granularity.

Act to Act Minimum	Bits 7-0 Hex Value
undefined	0
1 ns	1
2 ns	2
.	.
30 ns	1E
.	.
45 ns	2D
.	.
255 ns	FF

BYTE 29 - RAS to CAS Delay Min

This byte defines the minimum RAS to CAS delay ($t_{r\bar{c}d}$) using 1ns granularity.

RAS to CAS Delay Minimum	Bits 7-0 Hex Value
undefined	0
1 ns	1
2 ns	2
.	.
30 ns	1E
.	.
45 ns	2D
.	.
255 ns	FF

BYTE 30 - Minimum RAS Pulse Width

This byte defines the minimum activate to precharge time (Tras) using 1 ns granularity.

Activate to Precharge Minimum	Bits 7-0 Hex Value
undefined	0
1 ns	1
2 ns	2
.	.
60 ns	3C
.	.
75 ns	4B
.	.
90 ns	5A
.	.
255 ns	FF

BYTE 31 - Density of Each Row on Module

This byte describes the memory capacity of each physical row on the DIMM module.. This byte will have at least one bit set to a “1” to represent at least one row’s size. If there is more than one row on the module (as represented in Byte 5) and they have the same size, then only one bit in this field is set. If the module has more than one row of different sizes then more than one bit will be set. For example:

# Banks	Size of Row 1	Size of Row 2	Byte 31 contents
1	32MByte	N/A	0000 1000
2	32MByte	32MByte	0000 1000
2	32MByte	16MByte	0000 1100

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Size	512MByte	256MByte	128MByte	64MByte	32MByte	16MByte	8MByte	4MByte
N/Y	0	0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

BYTE 32 - 35 - Input setup and Hold time (Under JEDEC Committee Ballot no. JC42.5-97-119)

Definition of these bytes are in JEDEC Ballot process. The proposed data structure is as defined:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Positive/ Negative	Setup	Time	in ns	Setup	Time	in tenth	of a ns
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

- Bit 7 = 0 defines a positive setup time w.r.t. the clock
- Bit 7 = 1 defines a negative setup time w.r.t the clock
- Bit 6-4 = Defines the setup time in ns.
- Bit 3-0= Defines the setup time in tenth of a ns.

Some encoded values in the table:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Comment
0	0	0	0	0	0	0	0	0 ns
0	0	0	0	0	0	0	1	0.1 ns
0	0	0	0	0	0	1	0	0.2 ns
.	
0	0	0	0	1	0	0	1	0.9 ns
0	0	0	1	0	0	0	0	1.0 ns
0	0	0	1	0	0	0	1	1.1 ns
.	
0	0	0	1	1	0	0	1	1.9 ns
0	0	1	0	0	0	0	0	2.0 ns
.	
0	1	1	1	0	0	0	0	7.0 ns
.	
0	1	1	1	1	0	0	1	7.9 ns
1	0	0	0	0	0	0	1	-0.1 ns
1	0	0	0	0	0	1	0	-0.2 ns
.	
1	0	0	0	1	0	0	1	-0.9 ns
1	0	0	1	0	0	0	0	-1.0 ns
1	0	0	1	0	0	0	1	-1.1 ns
.	
1	0	0	1	1	0	0	1	-1.9 ns
1	0	1	0	0	0	0	0	-2.0 ns
.	
1	1	1	1	0	0	0	0	-7.0 ns
.	
1	1	1	1	1	0	0	1	-7.9 ns
x	x	x	x	1	0	1	0	RFU
.	RFU
x	x	x	x	1	1	1	1	RFU

BYTE 32 - Command and Address signal input setup time :

This byte describes the input setup time w.r.t the rising edge of the clock input. Both positive and negative setup times are supported.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Positive/ Negative	Setup	Time	in ns	Setup	Time	in tenth	of a ns
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

- Bit 7 = 0 defines a positive setup time w.r.t. the clock
- Bit 7 = 1 defines a negative setup time w.r.t the clock
- Bit 6-4 = Defines the setup time in ns.
- Bit 3-0= Defines the setup time in tenth of a ns.

Example:

For an address input setup time of:
 +2.5ns the byte value will be (0 010 0101)
 Similarly:
 For an address input setup time of:
 -0.5ns the byte value will be (1 000 0101)

BYTE 33 - Command and Address signal input hold time :

This byte describes the input hold time w.r.t the rising edge of the clock input. Both positive and negative hold times are supported.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Positive/ Negative	Hold	Time	in ns	Hold	Time	in tenth	of a ns
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

Bit 7 = 0 defines a positive hold time w.r.t. the clock
 Bit 7 = 1 defines a negative hold time w.r.t the clock
 Bit 6-4 = Defines the hold time in ns.
 Bit 3-0= Defines the hold time in tenth of a ns.

Example:

For a command input hold time of:
 +2.5ns the byte value will be (0 010 0101)
 Similarly:
 For a command input hold time of:
 -0.5ns the byte value will be (1 000 0101)

BYTE 34 - Data signal input setup time :

This byte describes the input setup time w.r.t the rising edge of the clock input. Both positive and negative setup times are supported.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Positive/ Negative	Setup	Time	in ns	Setup	Time	in tenth	of ns
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

Bit 7 = 0 defines a positive setup time w.r.t. the clock
 Bit 7 = 1 defines a negative setup time w.r.t the clock
 Bit 6-4 = Defines the setup time in ns.
 Bit 3-0= Defines the setup time in tenth of a ns.

Example:

For a data input setup time of:
 +2.5ns the byte value will be (0 010 0101)
 Similarly,
 For a data input setup time of:
 -0.5ns the byte value will be (1 000 0101)

BYTE 35 - Data signal input hold time :

This byte describes the input hold time w.r.t the rising edge of the clock input. Both positive and negative hold times are supported.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Positive/ Negative	Hold	Time	in ns	Hold	Time	in tenth	of a ns
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

Bit 7 = 0 defines a positive hold time w.r.t. the clock
 Bit 7 = 1 defines a negative hold time w.r.t the clock
 Bit 6-4 = Defines the hold time in ns.
 Bit 3-0 = Defines the hold time in tenth of a ns.

Example:

For a data input hold time of:
 +2.5ns the byte value will be (0 010 0101)
 Similarly,
 For a data input hold time of:
 -0.5ns the byte value will be (1 000 0101)

BYTE 62 - SPD Data Revision Code

This byte specifies the JEDEC SDRAM DIMM SPD Data revision to which the module conforms.

SPD Revision	Bits 7-0 Hex Value
Current Release Nov 97	12
.	.

This byte indicates the SPD revision number. For SPD revision 1.2 and higher it should be encoded in BCD. For example for SPD rev 1.2 data should be 12.

BYTE 63 - Checksum for Bytes 0-62

This byte is the checksum for bytes 0 through 62. This byte contains the value of the low 8-bits of the arithmetic sum of bytes 0 through 62.

BYTES 64-71 - Manufacturer's JEDEC ID Code

BYTE 72 - Manufacturing Location

BYTE 73-90 - Manufacturer's Part Number

BYTE 91-92 - Revision Code

BYTE 93-94 - Manufacturing Date

Definition of these bytes are in JEDEC Ballot process. The proposed data structure is as TBD

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

BYTE 95-98 - Assembly Serial Number

BYTE 99-125 - Manufacturer Specific Data

BYTE 126 - Intel specification for frequency

This byte defines the clock frequency of the Intel SDRAM DIMM specification.

Intel Specification Frequency	Hex Value
66 Mhz	66 ¹
100 Mhz	64

¹ The 66hex value for 66Mhz is preserved for backward compatibility

For 100Mhz support this byte should be programmed to (64)h.
 For 66Mhz support this byte should be programmed to (66)h, which is required for backward compatibility with existing BIOSes.

BYTE 127 - Intel Specification details for 100MHZ Support

This byte defines the SDRAM component and Clock interconnection details for the DIMMs as defined:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2 ²	Bit 1	Bit 0 ³
CLK0	CLK1	CLK2	CLK3	Junction Temp	CAS Latency = 3	CAS Latency = 2	Intel "Concurrent AP"
1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0	1 or 0

bit7= 1: CLK0 is connected on the DIMM
 bit7= 0: CLK0 is not connected on the DIMM
 bit6= 1: CLK1 is connected on the DIMM
 bit6= 0: CLK1 is not connected on the DIMM
 bit5= 1: CLK2 is connected on the DIMM
 bit5= 0: CLK2 is not connected on the DIMM
 bit4= 1: CLK3 is connected on the DIMM
 bit4= 0: CLK3 is not connected on the DIMM
 bit3= 1: 100°C junction temp
 bit3= 0: 90°C junction temp
 bit 2 and bit 1 = CL3 and CL2 support as shown:

Performance Grade	Hex Value (Bits 2-1)
CAS Latency 3	04
CAS Latency 2	06

bit0= 1: It supports Intel defined Concurrent AutoPrecharge
 bit0= 0: It does not supports Intel defined Concurrent AutoPrecharge

Example 1:

Byte 127 with the following encoding will imply:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
CLK0	CLK1	CLK2	CLK3	Junction Temp	CAS Latency = 3	CAS Latency = 2	Intel AP
1	0	1	0	0	1	1	1

A Single sided DIMM
 CLK0 and CLK2 connected on the DIMM
 90°C junction temp
 SDRAMs with CL=2 support⁴ and SDRAMs supporting Intel defined Concurrent AutoPrecharge

Example 2:

Byte 127 with the following encoding will imply:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
CLK0	CLK1	CLK2	CLK3	Junction	CAS	CAS	Intel AP

² Bits 2 and 3 are “preserved” for backward compatibility with existing BIOSes
³ For a complete definition of “Intel Concurrent AP” functionality consult Intel’s PC-SDRAM specification.
⁴ For full CL=2 support at 100mhz BIOS needs to check SPD bytes 18, 23, 24.

SDRAM Serial Presence Detect Data Structure

				Temp	Latency = 3	Latency = 2	
1	1	1	1	1	1	1	1

A Double sided DIMM

CLK0, CLK1, CLK2 and CLK3 are all connected on the DIMM

100°C junction temp

SDRAMs with CL=2 support⁵ and supporting Intel defined Concurrent AutoPrecharge

⁵ For full CL=2 support at 100mhz BIOS needs to check SPD bytes 18, 23, 24
